Trần Nhật Anh (Violet Tran)

Senior Backend Engineer

Hanoi, Vietnam · japananh@gmail.com
linkedin.com/in/japananh · github.com/japananh

SUMMARY

Backend Engineer, 7+ years in software development, now specialized in product AI — MCP servers, agent workflows, and measuring what they produce. Looking for a senior/staff **individual-contributor** role.

TECHNICAL SKILLS

Languages:	Golang, SQL, TypeScript / JavaScript
Technologies:	PostgreSQL, Redis, gRPC & Protocol Buffers, GraphQL, REST, AWS (ECS, RDS, S3, CloudFormation), Terraform, Docker, CI/CD (CodeBuild, GitHub Actions), Sentry, Node.js
AI engineering:	MCP server development, custom agent skills and hooks, agent orchestration, agent evaluation & feedback loops, model benchmarking (runtime, token cost, accuracy), prompt engineering, LLM application development (Anthropic, OpenAI models), AI-assisted development (Claude Code)
Other:	System design, API design, microservices, event-driven architecture, clean architecture, design docs / ADRs, code review, test-driven development (TDD), unit and integration testing, technical mentoring, Agile / Scrum

EXPERIENCE

Senior Backend Engineer — GemCommerce

Oct 2023 – Present

Hanoi, Vietnam (Hybrid) · GemPages — Shopify conversion rate optimization platform, microservices

Tech: Golang, gRPC, GraphQL, PostgreSQL, AWS

- Built the **MCP layer** that lets merchants clone a page, generate a landing page or research a product just by chatting with an AI assistant, and **cut the cost of converting a page through it by 61%** compared with the first release.
- Built an evaluation harness that scores every generated page against fixed quality criteria and catches silent content loss, then used it to benchmark models on speed, cost and accuracy and pick the right model for each flow.
- Added an in-product rating step at the end of each AI flow; **82% of merchant ratings are positive**.
- Led internal workshops that helped engineers adopt AI coding agents in their daily work.

Backend Engineer — 200Lab Education

Jun 2023 – Oct 2023

Ho Chi Minh City, Vietnam (Remote)

Tech: Golang (Gin, Gorm), PostgreSQL, Kafka, Redis, Docker

- Built features for the learning platform and the hands-on projects inside each course, following clean architecture.
- Wrote **published technical articles** on Kafka, RabbitMQ and LLM APIs, and reviewed other authors' articles for technical accuracy on the company engineering blog.

Backend Engineer — **Savvycom Software** Jun 2022 – May 2023
Hanoi, Vietnam
Tech: Golang (Gin, Gorm, Go-zero), PostgreSQL, gRPC, AWS, Redis, Jenkins

- Migrated **millions of records from DynamoDB to PostgreSQL time-series** tables in a user-tracking product, taking the main queries **from timing out to milliseconds**.
- Built APIs and unit tests for a payment service integrating **Stripe and PayPal** gateways.
- Designed and delivered cloud services on AWS across three products — payments, user tracking and authentication.
- Mentored **5+ new joiners** onto the codebase and team practices.

Software Engineer — **Azoom Vietnam** Apr 2021 – Jan 2022
Hanoi, Vietnam · Japanese ERP platform
Tech: Node.js, Vue.js, MySQL, Google Cloud (GCP), Docker

- Built REST APIs for the company ERP platform on Node.js and MySQL.
- Implemented front-end forms and UI components in Vue.js, cutting user-reported UI issues by **25%**.
- Onboarded and mentored new hires and interns, raising their first-month output by **30%**.

Software Engineer — **Seta International Vietnam** Sep 2019 – Nov 2020
Hanoi, Vietnam · BlueEye — AI training-data platform
Tech: React, Node.js, PostgreSQL, MongoDB, AWS, Jenkins

- Built a **data-labeling tool from scratch** on HTML Canvas and React, plus a real-time chat tool on socket.io — improving the quality of training data for the company's machine-learning models.
- Replaced a 7-year-old PHP timesheet server, incompatible with new facial-recognition hardware, with a Node.js service: **50% less code** and **35% faster** delivery of new features.
- Published the project's API foundation as open source: node-express-postgres-boilerplate.

OPEN-SOURCE

- **aimonitor** — Golang. macOS menu-bar app and CLI that monitors multi-account AI coding usage, bundled with an **MCP server** exposing Slack, ClickUp and Sentry to AI agents. Ships with CI, release automation and in-place self-update; released continuously since 2026.
- **sshoal** — SSH-tunnel supervisor with auto-reconnect and health checking (macOS, Linux). **Built agent-assisted in Rust**: I specified the architecture — a transport boundary that keeps the core headless-testable on a simulated clock — and reviewed the implementation. Runs a **guarded auto-fix bot** in CI: issues from the maintainer get an automated fix, anyone else gets read-only triage.

CERTIFICATIONS

- **FreeCodeCamp** — Legacy Full Stack Certification (2021)
- **CS50** — Introduction to Computer Science (Harvard/edX)
- **HackerRank** — hackerrank.com/japananh
